and ſcirrous. He ſaith, he cut it athwart, and found the inner Subſtance of it very full of Veſſels, of which he ſounded many, and found, that though it was hard, yet it was very full of Pipes running thorough it, which made him at firſt imagine, that as the Spermatique and Hypogaſtrique Channels of a breeding Woman grew big in proportion, that the *Embyro* is nouriſh'd; ſo theſe Hypogaſtrique Veins and Arteries of the Bladder, were all dilated and widened to feed theſe *Caruncles*, which from thence, as their *placenta*, drew all their nouriſhment: But when he ſaw that theſe Tubes did far exceed their ordinary number, he believed, that this was from thence, becauſe that each capillary Branch, whoſe ſmallneſs doth commonly hide them from us, was much ſtretch'd in this Caſe, to furniſh this *Matrix*, (if it may be ſo called) with more Blood than ordinary.

Errata in *Numb.* 126.
